U.S. Drought Monitor

July 12, 2016

(Released Thursday, Jul. 14, 2016) Valid 8 a.m. EDT

Intensity:

http://droughtmonitor.unl.edu/Home/RegionalDroughtMonitor.aspx?west

U.S. Seasonal Drought Outlook Drought Tendency During the Valid Period

Valid for June 16 - September 30, 2016 Released June 16, 2016

Depicts large-scale trends based on subjectively derived probabilities guided by short- and long-range statistical and dynamical forecasts. Use caution for applications that can be affected by short lived events. "Ongoing" drought areas are based on the U.S. Drought Monitor areas (intensities of D1 to D4).

NOTE: The tan areas imply at least a 1-category improvement in the Drought Monitor intensity levels by the end of the period, although drought will remain. The green areas imply drought removal by the end of the period (D0 or none).

Drought persists

Drought remains but improves

Drought removal likely

Drought development likely

Water Use in Southern Nevada

Water Use in Southern Nevada January – June 2016

2016: Consumptive Use = $105,818^*$ af

2015: Consumptive Use = 100,338 af

Difference = 5,480 af

*Subject to final accounting.

Water Use Comparison

January - June

Water Use	2015 Acre Feet	2016 Acre Feet	Difference Acre Feet	% Change	
Las Vegas Wash Gauged Flow	110,392	112,970	2,578	2.3%	
Diversions	210,807	214,438	3,631	1.7%	
Return Flow Credit	110,469	108,620	-1,849	-1.7%	
Consumptive Use	100,338	105,818	5,480	5.5%	

Return Flow Credit Calculations

- The Colorado River Commission is responsible for calculating Nevada's Return Flow Credit calculations and providing consumptive use to Reclamation each month.
- Colorado River use data is submitted:
 - Basic Water Company
 - SNWA (Boulder City, LVVWD, North Las Vegas, Nellis Air Force Base)
 - Big Bend Water District
 - National Park Service
 - Reclamation
 - Department of Wildlife
 - Fort Mojave
 - And waste water discharge and ground water operations
- The Colorado River Commission works with Reclamation to finalize the year end water accounting of Nevada's Colorado River water use. http://www.usbr.gov/lc/region/g4000/wtracct.html
- A number of factors can impact how Return Flow Credits are calculated:
 - Weather: (precipitation, temperature, and wind)
 - Reuse
 - Ground water use or recharge
 - Lost or unaccounted water
 - Gage error

Why are return flow credits down?

Response to commissioner Kelly's question

Return flow credits are down 1.7% or 1,849 af in 2016 compared to January-June 2015. After analyzing return flow credits this year with last year, these are a few factors that contributed to the difference:

Economic Growth

• SNWA has increased user accounts which has increased diversions over last year.

Weather

- Precipitation January, February, March, and May were all drier than last year.
- Temperature May and June were hotter than last year.

Most of this year has been drier and May+June were hotter which probably resulted in more water being used outdoors = Evaporation = Not making it to the wash.

Operational Differences

- There is an increase of 1,605 af in 2016 of unaccounted water that was diverted, but not delivered.
- Ground water well pumping is 2,229 af less than last year.

It is difficult to know what factor contributed the most to the change, but weather and operational differences both likely decreased the return flow credits compared to last year. The decrease of 1.7% is relatively small and could fluctuate depending on future weather and operations. 19
